

# HIPURO

## HIGH PURITY WATER

---

HIPURO is a high quality water manufactured by FUJIFILM by means of reverse osmosis (R.O.), with the same high level of quality as for any other FUJIFILM product.

Reverse osmosis is known as one of the best methods for water purification. By using this method, FUJIFILM is able to produce a water, whose purity meets any requirements, whenever a high grade product is necessary. It will also be an economical alternative to other on-site systems, allowing constant pure water utilisation.

As part of the Fuji Hunt product range, HIPURO will go through our usual quality control procedures during production and filling processes. We will then be able to guarantee a maximum conductivity for each production batch, which will be stamped on each label.

HIPURO should be used each time water becomes a key issue in photo processing such as :

- Superstabilizer or final rinse water in minilab processes, an issue becoming even more important with APS film introduction;
- Stabilizer water for Rack & Tank processors, minimising the risk of drying marks on films;
- Developer water when a high tap water hardness is causing precipitates in the processor tanks;
- Picrostat water.
